CONTENTS

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

Type LV-6 High Voltage Capacitors (for L=6%) Combined Output 10-100kvar	4
Type LV-6 High Voltage Capacitors (for L=6%) Combined Output 150-500kvar	5
Type LR-3 Series Reactors (for L=6%, I _s =55%) Combined Output 10-1000kvar	6
Type LV-6 High Voltage Capacitors (for L=13%) Combined Output 10-500kvar	8
Type LR-3 Series Reactors (for L=13%, I _s =35%) Combined Output 10-500kvar	10
Protection of High Voltage Capacitors & Reactors	12
Type LV-6 Capacitors Banks (Double Star Connected) (for L=6%) Combined Output 200-300kvar	13
Type FHZ High Voltage Capacitors (for L=6%) Combined Output 1000-3000kvar	14
Type Q-PAC-1B High Voltage Capacitor Equipment (for L=6%, I _s =55%) Combined Output 100-1000kvar	15
Type Q-PAC-2B High Voltage Capacitor Equipment (for L=6%, I _s =55%) Combined Output 100-1000kvar	16
Type Q-PAC-2B High Voltage Capacitor Equipment Coupled with Duct (for L=6%, I _s =55%) Combined Output 100-1000kvar	17
Type HA-PAC High Voltage Capacitor Equipment with Automatic Capacitor Control (for L=6%, I _s =55%) Combined Output 200-600kvar	18

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

Type GFC-5 Gas Filled High Voltage Capacitors (for L=6%) Combined Output 10-300kvar	19
Type LR-MB Series Reactors (for L=6%, I _s =55%) Combined Output 10-1000kvar	21
Type GFC-5 Gas Filled High Voltage Capacitors (for L=13%) Combined Output 10-300kvar	22
Type LR-MB Series Reactors (for L=13%, I _s =35%) Combined Output 10-500kvar	23
Type DCM-B Power Capacitor Discharge Coils	24
Protection of Gas Filled High Voltage Capacitors & Reactors	25

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

Type N2 (200V) & E(200V, 400V) Low Voltage Power Capacitors	26
Type RG-2 220V Low Voltage Power Capacitors (for L=6%) Combined Output 10-50kvar	31
Type RG-2 440V Low Voltage Power Capacitors (for L=6%) Combined Output 10-100kvar	32
Type GFC-5 Gas Filled 220V Low Voltage Power Capacitors (for L=6%) Combined Output 10-50kvar	33
Type GFC-5 Gas Filled 440V Low Voltage Power Capacitors (for L=6%) Combined Output 20-100kvar	34
Type DR-1 Series Reactors (for L=6%, I _s =55%) Combined Output 10-300kvar	35
Oil-less V-PAC for Installation in Panels (with L=6%, I _s =55%)	36
Free Standing Enclosed V-PAC II (with L=6%, I _s =55%)	37

4 SURGE ABSORBING CAPACITORS & GROUNDING CAPACITORS

5 HIGH FREQUENCY CAPACITORS

Plastic Film Capacitors (ETHY-CON)	40
------------------------------------	----

Water Cooled Capacitors	41
-------------------------	----

6 AUTOMATIC CAPACITOR CONTROLLERS

Type SQ-S4	42
------------	----

Type Q-AUTOMAT III	43

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

TYPE LV-6 HIGH VOLTAGE POWER CAPACITORS & REACTORS

• HIGH VOLTAGE POWER CAPACITORS

Type LV-6 high voltage power factor correction capacitors employ the plastic film only having superior dielectric strength and utilize the electrodes of unique construction, achieving low loss (as low as approx. 1/3 of our conventional capacitors) and significantly high current handling capability.

FEATURES

① Extremely Low Loss to Save Energy

The use of all plastic film dielectrics and proprietary electrode construction has reduced the loss of film itself to approximately 1/3 of our conventional design, offering significant saving in capacitor operation cost.

② Higher Safety Factor for Temperature against Harmonics

Temperature rise has been reduced considerably (to approximately 1/2 of our conventional design) due to lower loss, providing a higher safety factor for temperature against overload caused by harmonic currents. In addition, the capacitors can be operated at up to 50°C (temperature class B) due to lower temperature rise during operation.

③ Enhanced Current Handling Capability

The proprietary extended foil construction has enhanced greatly the capability to handle inrush current appearing when the capacitors are switched on or off.

④ Superior Reliability

The use of polypropylene film dielectrics with excellent electrical performances has enhanced dielectric strength and reliability.

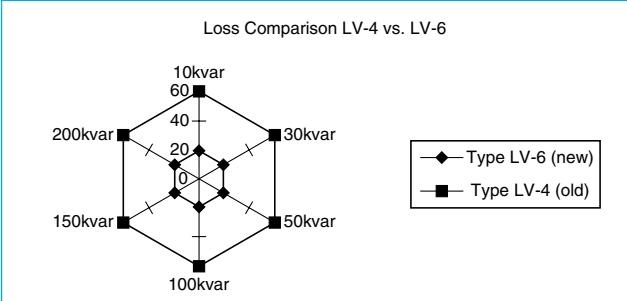

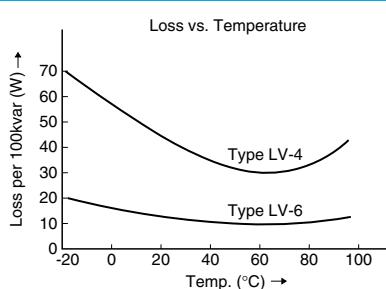

⑤ Fault Detector (MDA-1) for 150kvar or more

The fault detector is free of leaks to provide high reliability, with its simple construction to facilitate maintenance and easy mounting.

ENERGY SAVING

If LV-4 100kvar x 10 units are replaced with type LV-6, annual energy saving will amount to

(60-20) W x 10 units x 24 hr x 365 days = 3,504kWhr.

HOW TO DETERMINE CAPACITOR OUTPUT

(percentage of load kW)

Existing Power Factor ($\cos\phi$)	1.0	0.99	0.98	0.97	0.96	0.95	0.94	0.93	0.92	0.91	0.9	0.875	0.85	0.825	0.8	0.775	0.75	0.725	0.7	0.675	0.65	0.625	0.6	0.575	0.55	0.525	0.5	0.475	0.45	0.425

Example

① To improve power factor from 0.75 for 500kW load to 0.95, the table gives a percentage of 55%.

Required capacitor output = 500kW x 0.55 = 275kvar

② For loads rated at kVA, calculate in a manner to similar to ① by converting kW=kVAXcosφ.

• TYPE LR-3 SERIES REACTORS

Multiple capacitors connected to a circuit for power factor correction may cause the waveform of the circuit voltage especially the 5th harmonic to be distorted more. This is because the capacitors connected make the impedance of the circuit capacitive. Harmonics contained in the voltage waveform may increase noise in a transformer, or may cause an excessive current to flow through the capacitor circuit resulting in a failure of the capacitors. To solve these problems, reactors should be added in series with the capacitors to make the impedance of the circuit inductive for harmonics for the improvement of the distorted waveform.

Series reactors are used for this purpose. Series reactor will improve not only the waveform but also will help reduce the inrush current that will flow through capacitors when the capacitors are switched on or prevent switches from restriking when the capacitors are switched off.

APPLICATION NOTES

• Noise

Series reactors are constructed to provide air gap in the core. Special consideration is given to the design and manufacture of the series reactors to minimize buzzing to be generated by the air gap. When series reactor are installed in a small sealed room, buzzing may be echoed or resonate with that of the existing transformer resulting in amplified buzzing. To prevent this problem, it is recommended to secure reactors on the floor tightly by foundation bolts. If buzzing is still audible, add a rubber pad. Higher content of harmonics may cause a higher noise, but does not affect the performance or life of the reactors adversely as long as the current flowing in the reactor does not exceed the permissible limit.

• Matching with capacitor output

Series reactors are intended to be connected in series with other device, and work effectively when combined with a capacitor whose output matches with that of the reactor.

For example, a 6.38kvar reactor will have 6% reactance to improve the waveform of the 5th harmonic only when connected to a 106kvar capacitor. When connected to a 53.2kvar capacitor, the 6.38kvar reactor will have an output of

$$6.38\text{kvar} \times \left(\frac{53.2\text{kvar}}{106\text{kvar}} \right)^2 = 1.61\text{kvar}$$

Therefore, it will have 3% reactance for the 53.2kvar capacitor and will not work effectively for the 5th harmonic. It may amplify harmonics.

• Addition of series reactor to some of capacitors

If some of capacitors installed in the same system do not have series reactors, harmonics may be amplified depending on percentage of capacitors without reactors. It is recommended that the capacitors which account for at least 2/3 of the total output be provided with a reactor.

CIRCUIT PROTECTION

When harmonic current exceeding the limit flows in the reactor, the reactor may burn out. Connect the Thermal Sensor attached to the reactor to a circuit breaker to protect the reactor. See page 12.

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

TYPE LV-6 HIGH VOLTAGE CAPACITORS (for L=6%) Combined Output 10-100kvar

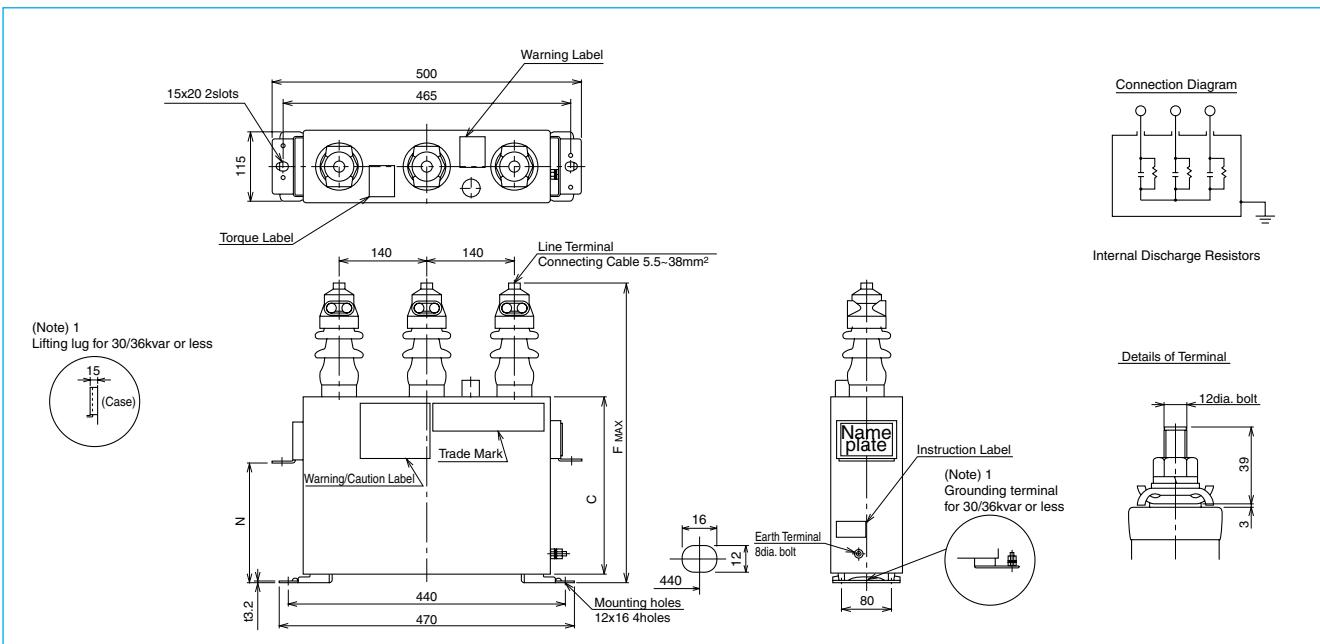

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	LV-6, oil filled and self cooled
Installation Location	Indoor & outdoor
Temperature Class	-20B
(Ambient temperature	-20°C to +50°C, provided 24 hour average is 45°C max.
Output Tolerance	-5% to +15% of rated output (Unbalance among phases 1.08 or less)
Voltage Withstand	T - T : 2 x rated voltage T - C : 16kV (for 3510V) 22kV (for 7020V)

Insulation Level	16/45kV, 22/60kV
Dissipation Factor	0.025% max. at 20°C
Permissible Overload	110% of rating (12 hours max.)
Maximum Voltage	per 24 hours)
Permissible Overload	130% of rating (not including current due to cap. tol.)
Maximum Current	
Discharge Resistors	Discharge to 50V or less in 5 minutes
Paint Color	Munsell 5Y7/1
Applicable Standard	JIS C 4902-1998

DIMENSIONS (mm)

- (Notes) 1. The units with combined output of 30/36kvar or less do not have lifting lugs. The grounding terminal is located at the mounting foot.
 2. To assemble two or more capacitors, secure the spacing of 50mm or more between units.
 3. Permissible limit for bulge (one side) in case is 10mm for combined output of 10/12-50kvar and 15mm for 75-100kvar.
 4. For protection of the system, see page 12.

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

PROTECTION OF HIGH VOLTAGE CAPACITORS & REACTORS

High voltage power capacitors can be said to be a static apparatus with extremely high reliability. However, overheat, burning out, short circuit or case rupture may occur, should a capacitor fail due to service conditions including overvoltage and excessive harmonics. Therefore, it is required that capacitors be protected against failure. Protection should be coordinated with failure characteristics of capacitor equipment and the following protections are recommended.

Rated Equipment Output	Recommended Protection
10kvar - 100kvar	Current limiting fuses & thermal sensors
150kvar - 500kvar	Fault Detector (MDA-1), current limiting fuses & thermal sensor

(Notes) 1. For recommended rated current of fuses, refer to the recommendation of the fuse manufacturers.

2. Install fuses at the power supply side of series reactors.

3. Capacitors rated at 200kvar or more can be supplied with double star connection.

• HIGH VOLTAGE CAPACITORS

Fault Detectors (MDA-1)

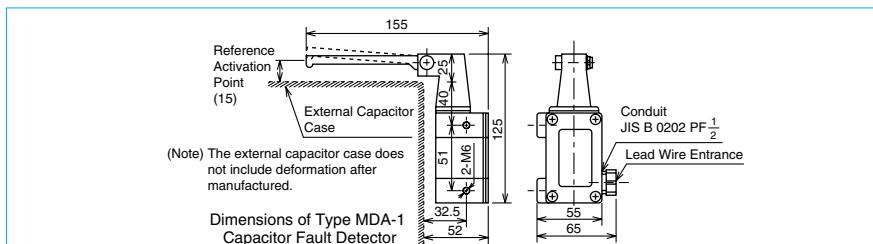

Large kvar capacitors will develop a zone where the case rupture can not be protected by current limiting fuses if the breakdown will last for a long time. Conveniently, it is known that the larger the capacitor kvar or for capacitors with star connection, the more the case bulges. Type MDA-1 fault detector will sense the bulge in case to protect the case rupture. Excessive bulge in the case caused by failure in the capacitor will activate the micro switch which will then generate the signal to trip a circuit breaker.

Type of Contact	1a+1b			
Contact	Voltage(V)	125(AC)	250(AC)	110(DC)
Capacity	Current(A)	10	10	5
Dielectric Strength				2000VAC, 1 minute

(Notes) 1. The currents are momentary when the circuit breaker is tripped.

2. The fault detector is packed separately from the capacitor. Mount it when the capacitor is installed.

TYPICAL CONNECTION OF FAULT DETECTOR TO CIRCUIT BREAKER

Breaker Trip Method	Connection of fault detector to breaker	Remark
Voltage Trip Method		The fault detector is connected direct to a trip coil

• SERIES REACTORS

Protection Method

JIS C 4902 specifies that series reactors for power capacitors shall be operated at a current which contains the 5th harmonic current of not more than 55% of the fundamental current with the root of the sum of the squares limited to not more than 130% of the rated current. If the 5th harmonic voltage distortion is excessively high, some current exceeding the limit will flow through the reactor possibly causing excessive temperature rise to burn out the reactor.

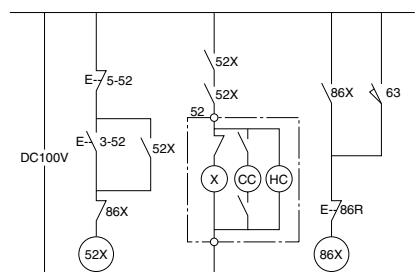

The reactors are equipped with a Thermal Sensor to detect excessive temperature rise. Connect the sensor to a circuit breaker (or a switching device) located in the upper stream to disconnect the reactor from the power source. Reactors with a dial thermometer is also available as an option.

Method	Thermal Sensor
Contact Capacity	AC 125V 8.0A DC 125V 0.2A
Contact Arrangement	
Activating Temperature	85°C

Application Notes for Protective Contacts

Connect the capacitor fault detectors and the reactor Thermal Sensors to the trip circuit of circuit breakers or switching devices. The activation of the above contacts to trip the circuit is considered a major failure. Consideration should be given to the protective circuit as shown below to prevent reclosing as it is.

Typical Circuit to Prevent Reclosing after Tripped by Protective Contacts

52 : Capacitor Switching Device
52X : Auxiliary Relay
3-52 : Closing Switch
5-52 : Opening Switch
63 : Fault Detector (Capacitor) or Thermal Sensor (Reactor)
86X : Auxiliary Relay
86R : Reset Switch

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

TYPE LV-6 CAPACITOR BANKS (DOUBLE STAR CONNECTED) (for L=6%) Combined Output 200-300kvar

The capacitor consists of two star-connected capacitors with the neutrals connected together. When the capacitor fails, a current will flow between the neutrals. The current will be sensed and used as a signal to trip a circuit breaker.

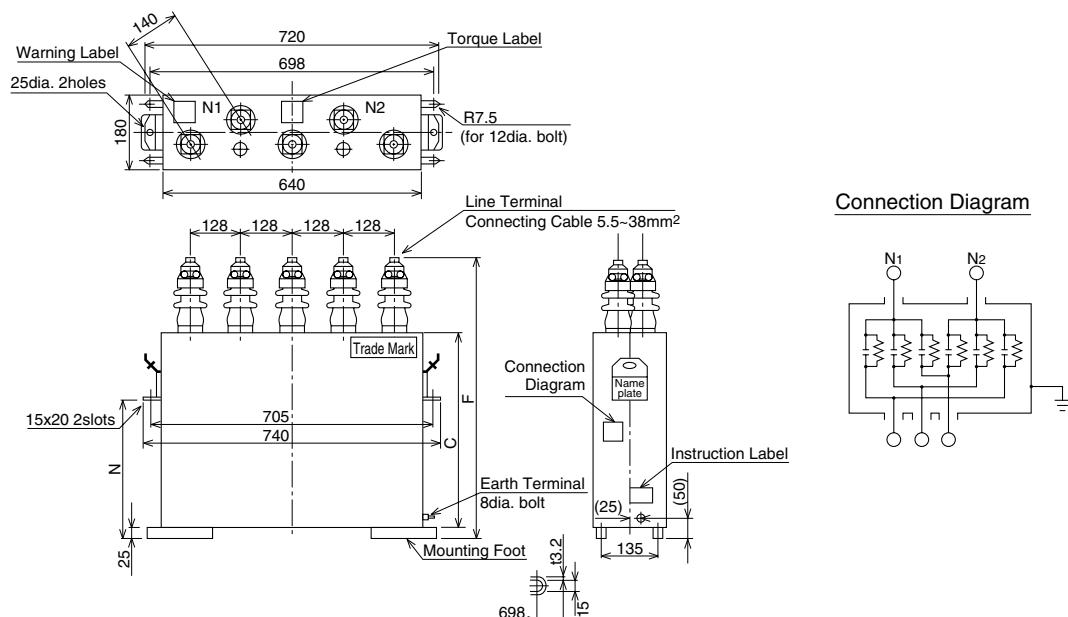

The protection scheme has been implemented to protect extra-high voltage capacitors and work very well to detect capacitor failure in early stage.

2. The ratings are for capacitors to be connected in series with a 6% reactor.

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

TYPE FHZ HIGH VOLTAGE CAPACITORS (for L=6%) Combined Output 1000-3000kvar

Type FHZ high output capacitors offer the advantages given by high output units, making use of high performance of film dielectric layers.

FEATURES

① Low Power Loss

Running power can be saved as the loss is reduced to approximately 1/2 of the conventional paper capacitors.

② High Resistance for Contamination

Number of bushings is minimized as the capacitors are enclosed in a large tank. In addition, the capacitors are

immune to leaks resulting from rust due to thick tank plates used. It is recommended to install the capacitors especially at any contaminated locations.

③ Easy maintenance

Daily maintenance is not required due to the simple external construction.

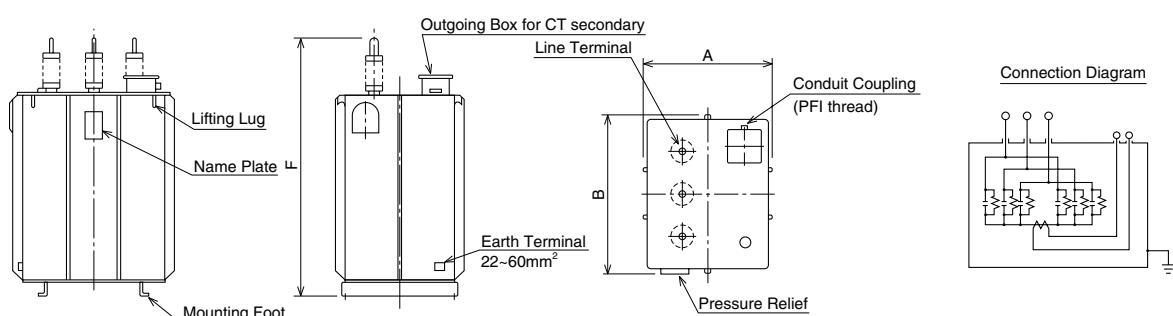

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	FHZ, oil filled and self cooled
Installation Location	Indoor & outdoor
Temperature Class	-20/A

1 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (Oil Filled & Self-cooled)

TYPE Q-PAC-2B HIGH VOLTAGE CAPACITOR EQUIPMENT (for L=6%, Is=55%) Combined Output 100-1000kvar

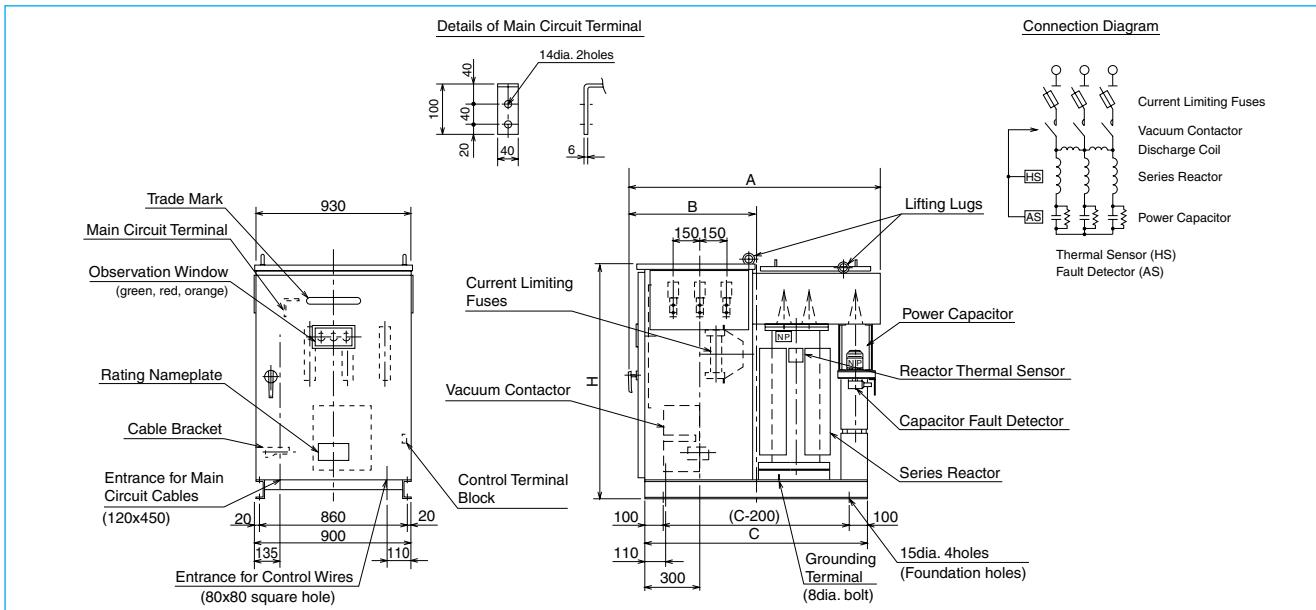

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	Q-PAC-2B
System Voltage	3300V or 6600V
Number of Phases	3 phase
Frequency	50Hz or 60Hz
Series Reactors	6% of capacitor reactance
Switching Device	Vacuum Contactor
Operation Method	Constant excitation or moment excitation
Operation Voltage	100V & 200V DC or 100V & 200V AC

Installation Location	Indoor & outdoor
Service Temperature	-20°C to +40°C
Discharge Coil	Discharge to 50V or less in 5 seconds
Paint Color	Munsell 5Y7/1 (semi-gloss)
Applicable Standard	JIS C 4902-1998, JEM 1167

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

TYPE GFC-5 GAS FILLED HIGH VOLTAGE CAPACITORS (for L=6%) Combined Output 10-300kvar

Buildings and hotels being built near big cities are becoming more high-rise due to high land price, and public facilities and underground shopping centers are also becoming large. A large number of people gather at these facilities. The power receiving and distribution equipment installed at the facilities to support fundamental urban function require high safety and reliability. In particular, large stores, department stores, tenant buildings, welfare facilities and underground shopping centers require all possible measures against fires. Once a fire occurs, it will lead to a substantial social loss. The gas filled power capacitors are ideal for application at these facilities due to flame retardant properties.

FEATURES

- ①The capacitors are filled with harmless, incombustible and non-explosive gas, and are safe and immune to second disaster such as fires.
- ②Using the self-healing metallized film dielectrics, the capacitors provide high performances and reliability.
- ③To assure safety, the capacitors are provided with a lower pressure limit switch which activates at reduced gas pressure and with a safety valve and a upper pressure limit switch which activates at excessively increased pressure.
- ④SF6 gas is sealed inside the case at pressure slightly higher than ambient pressure. The capacitors will sustain the properties in case of reduction in gas pressure.
- ⑤Totally sealed case and line terminals with high sealing effect offer reliability for gas leaks, eliminating the requirement for maintenance.
- ⑥The capacitors require small mounting space and can be installed in a slim distribution panel.

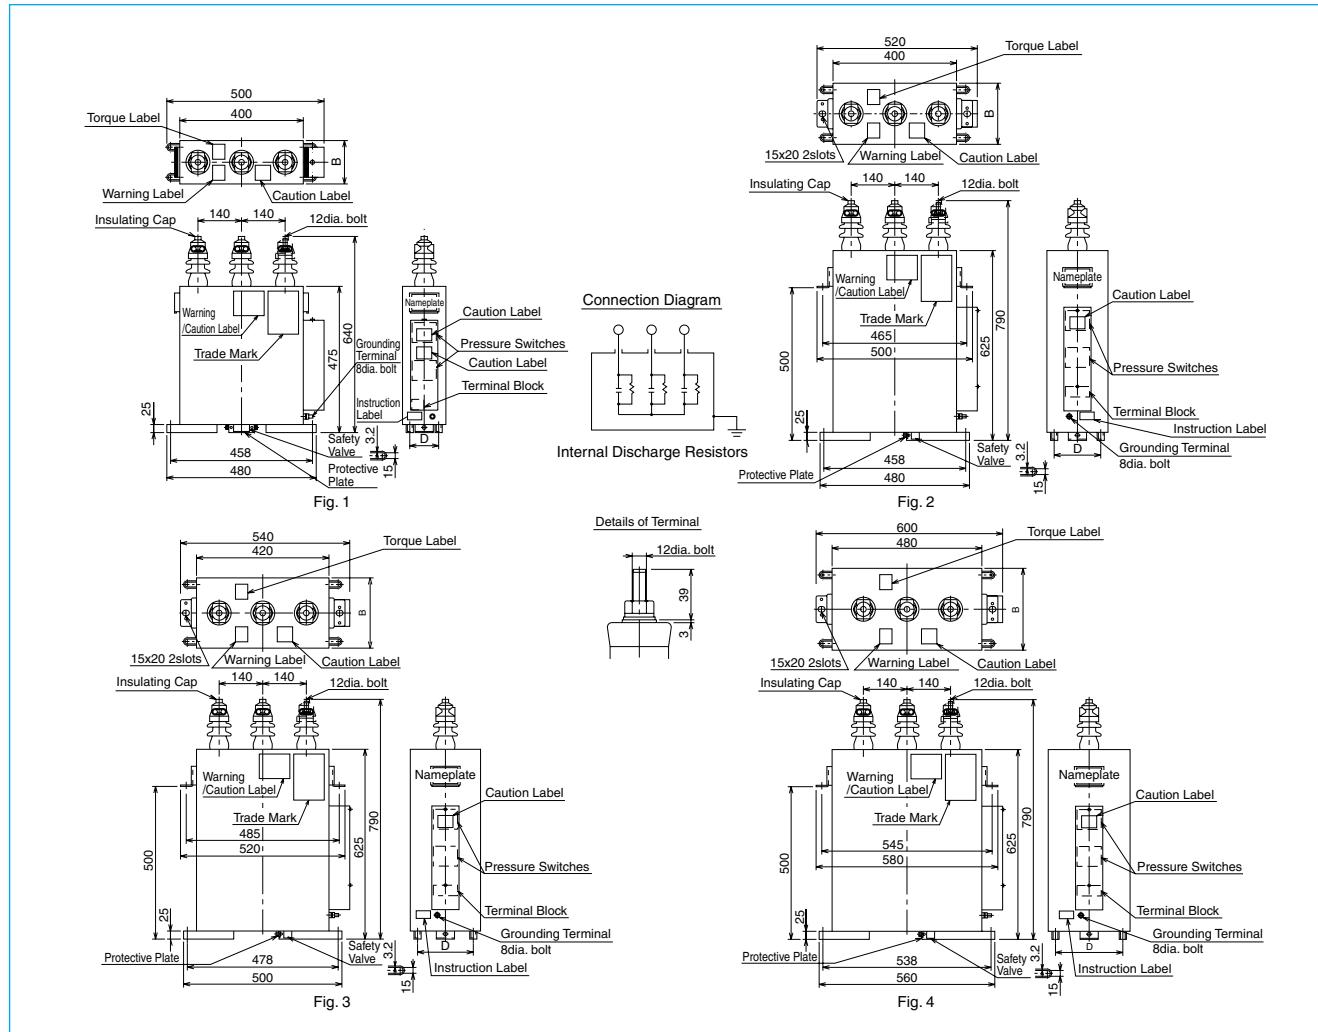

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	GFC-5, gas filled	Insulation Level	16/45kV, 22/60kV
Installation Location	Indoor only	Dissipation Factor	0.05% max. at 20°C
Temperature Class	-20/B	Permissible Overload	110% of rating (12 hours max.)
(Ambient temperature	-20°C to +50°C, provided 24 hour average is 45°C max.)	Maximum Voltage	per 24 hours)
Output Tolerance	-5% to +15% of rated output (Unbalance among phases 1.08 or less)	Permissible Overload	130% of rating (not including current due to cap. tol.)

CIRCUIT PROTECTION

(Note) For protection of circuit, see page 25.

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

TYPE LR-MB SERIES REACTORS (for L=6%, I_s=55%) Combined Output 10-1000kvar

FEATURES

- Compact and lightweight to save mounting space
- Provided with a cushion rubber pad and a protective cover
- Self-extinguishing and flame retardant
- Provided with protection functions
- Very little insulation degradation caused by humidity absorption

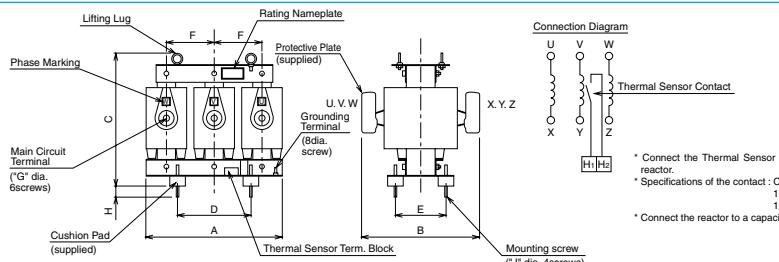

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	LR-MB, dry & molded	Rated Frequency	50Hz or 60Hz
Installation Location	Indoor only	Reactance	6% of capacitor reactance
Temperature Class	-20/B	Permissible Overload	Class II : 130% of rating (5th harmonic current-not more than 55% of the fundamental current)
(Ambient temperature)	-20°C to +50°C, provided 24 hour average is 45°C max.	Maximum Current	
Insulation Class	Class F	Temperature Rise	85°C max. at the coils (per resistance method)
Insulation Level	16/45kV, 22/60kV	Applicable Standard	JIS C 4902-1998
System Voltage	3300V or 6600V

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

TYPE LR-MB SERIES REACTORS (for L=13%, I_s=35%) Combined Output 10-500kvar

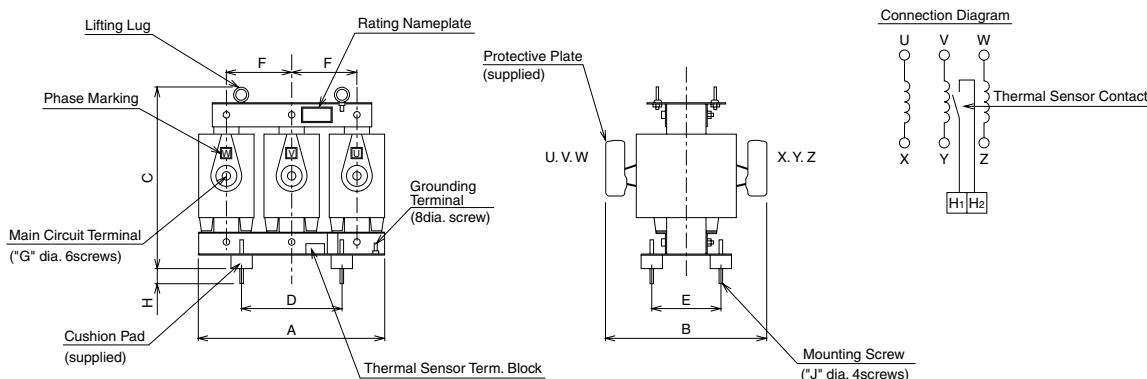

SPECIFICATIONS

System Voltage : 3300V or 6600V

Type	LR-MB, dry & molded
Installation Location	Indoor only
Temperature Class	-20/B
(Ambient temperature	-20°C to +50°C, provided 24 hour average is 45°C max.
Insulation Class	Class F
Insulation Level	16/45kV, 22/60kV
System Voltage	3300V or 6600V
Number of Phases	3 phase

Rated Frequency	50Hz or 60Hz
Reactance	13% of capacitor reactance
Permissible Overload	Class I : 120% of rating (5th harmonic current - not more than 35% of the fundamental current)
Maximum Current	
Temperature Rise	85°C max. at the coils (per resistance method)
Applicable Standard	JIS C 4902-1998

DIMENSIONS (mm)

* Connect the Thermal Sensor contact to a trip circuit to protect the reactor.
 * Specifications of the contact : Close at the temperature set (a contact)
 125VAC, 15A
 125VDC, 0.2A
 * Connect the reactor to a capacitor designed for L=13%.

(Note) For protection of circuit, see page 25.

(Notes) 1. The asterisk ★ denotes voltage. 33 and 66 represent 3300V and 6600V respectively.

2. The mark * denotes frequency. 5 and 6 represent 50Hz and 60Hz respectively.

3. The units with a dial thermometer are also available.

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

TYPE DCM-B POWER CAPACITOR DISCHARGE COILS

FEATURES

① Flame Retardant and Non-explosive

There is no risk of a fire owing to flame retardant and self-distinguishing epoxy used.

② Easy to Mount and Maintain

It is easy to mount the discharge coils which are compact, lightweight and can be mounted in any direction.

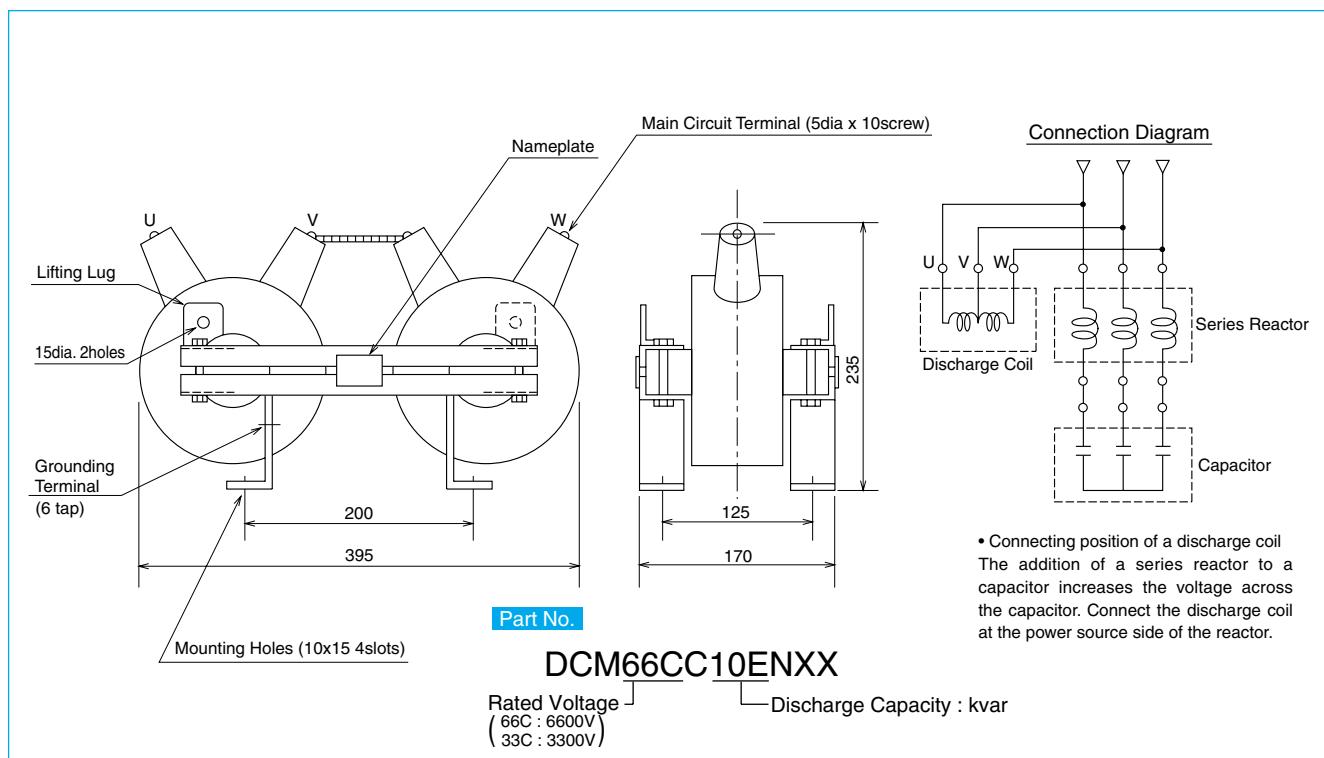

SPECIFICATIONS

Type	DCM-B, dry & molded
Installation Location	Indoor only
Temperature Class	-20/B
(Ambient temperature	-20°C to +50°C, provided 24 hour average is 45°C max.)
Insulation Level	22/60kV

System Voltage	6600V
Number of Phases	3 phase
Rated Frequency	50Hz or 60Hz
Discharge Capacity	1000kvar
Gross mass	19kg
Applicable Standard	JIS C 4902-1998

DIMENSIONS (mm)

(Note) The coils for 3300V rating are also available.

2 HIGH VOLTAGE POWER CAPACITOR EQUIPMENT (DRY)

PROTECTION OF GAS FILLED HIGH VOLTAGE CAPACITORS & REACTORS

• GAS FILLED CAPACITORS

Gas filled capacitors are designed to give high performance and reliability including tight gas seal capability and self-healing properties by the implementation of totally sealed construction and metallized film dielectrics. However, the following protection schemes are implemented just in case any failure occurs.

(1) If gas leakage occurs,

The lower pressure limit switch will be activated when the capacitor's internal pressure will be reduced to the ambient pressure. Use the contact circuit of the pressure switch to give an alarm or disconnect the capacitor.

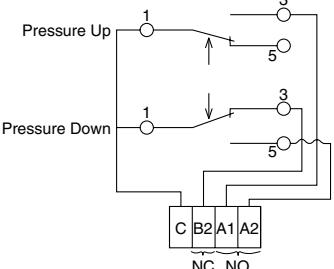

The capacitor will not need to be disconnected immediately after the alarm sounds. However, it is recommended to disconnect the capacitor within 24 hours.

(2) If the capacitor be internally broken down,

When the internal windings will be broken down, a fault current will flow and the decomposed gas will gradually increase the internal pressure.

The upper pressure limit switch will be activated when the internal pressure reaches the specified level. Use the contact circuit of the pressure switch to open a capacitor switching device or a circuit breaker in the upper stream.

Install current limiting fuses to protect capacitors from momentary short failure in the capacitor. Selection of fuses should be made in the same manner as the oil filled capacitors.

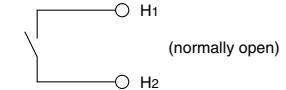

Contact Capacity	AC 125V 8.0A DC 125V 0.2A
Connection	
Activating Pressure	Up-78kPa Down-6kPa

• SERIES REACTORS

Protection Method

JIS C 4902 specifies that series reactors for power capacitors shall be operated at a current which contains the 5th harmonic current of not more than 55% of the fundamental current with the root of the sum of the squares limited to not more than 130% of the rated current. If the 5th harmonic voltage distortion is excessively high, some current exceeding the limit will flow through the reactor possibly causing excessive temperature rise to burn out the reactor.

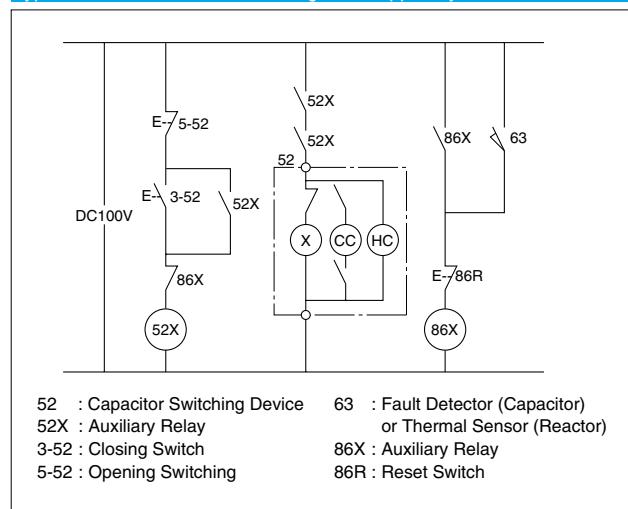

The reactors are equipped with a Thermal Sensor to detect excessive temperature rise. Connect the sensor to a circuit breaker (or a switching device) located in the upper stream to disconnect the reactor from the power source. Reactors with a dial thermometer is also available as an option.

Method	Thermal Sensor
Contact Capacity	AC 125V 15.0A DC 125V 0.2A
Arrangement	
Operating Temperature	100°C

• Application Notes for Protective Contacts

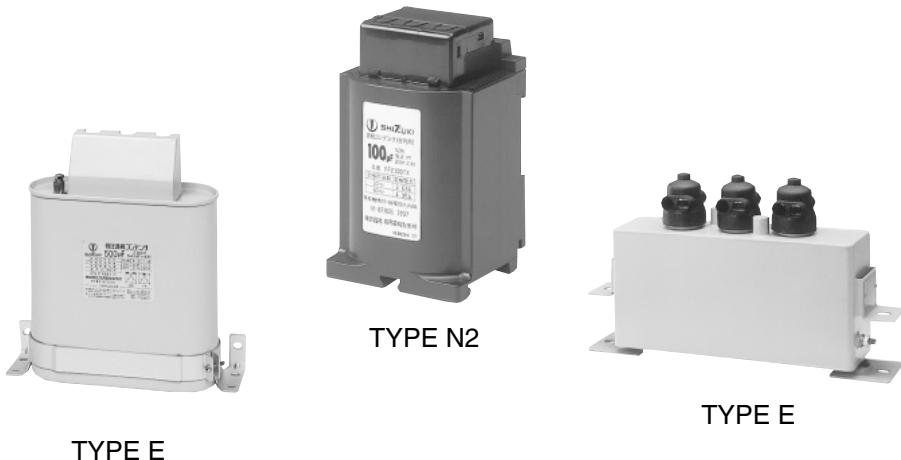

Connect the capacitor fault detectors and the reactor Thermal Sensors to the trip circuit of circuit breakers or switching devices. The activation of the above contacts to trip the circuit is considered a major failure. Consideration should be given to the protective circuit as shown below to prevent reclosing as it is.

Typical Circuit to Prevent Reclosing after Tripped by Protective Contacts

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

TYPE N2 (200V) & E (200V, 400V) LOW VOLTAGE POWER CAPACITORS

Shizuki Low Voltage Power Capacitors are the most economical means to save electrical power.

BENEFITS

① Electric Power Bills Are Reduced.

The installation of power factor correction capacitors will raise the power factor. For a higher power factor attained by users, lower electrical charges are generally offered by utility companies.

② Equipment Cost Is Reduced.

When power factor capacitors are added to new installation of plant equipment including welding machines that draw a high current, they will not only improve a power factor but also reduce a line current, saving the cost for distribution equipment.

③ Productivity Is Improved and Quality Becomes Consistent.

Power factor correction will help raise the voltage across a motor, increasing rotation torque and reduce voltage fluctuation, keeping consistent speed. Hence, productivity will be increased and quality will become consistent.

④ System Capacity Is Gained.

Improved power factor reduces line current. Power factor correction capacitors will relieve the capacity of distribution equipment (transformers, switching devices), and installation of the capacitors will enable new loads to be added without increasing the capacity of the existing distribution equipment.

STANDARD CAPACITOR OUTPUT

① Induction Motors (a) 200V 3 Phase Motors

Motor	kW	0.2	0.4	0.75	1.5	2.2	3.7	5.5	7.5	11	15	19	22	30	37	55
	HP	1/4	1/2	1	2	3	5	7.5	10	15	20	25	30	40	50	75
Capacitor	50Hz	15	20	30	40	50	75	100	150	200	250	300	400	500	600	900
	60Hz	10	15	20	30	40	50	75	100	150	200	250	300	400	500	750

(b) 200V 1 Phase Motors

Motor	kW	0.1	0.2	0.4	0.75
	HP	1/8	1/4	1/2	1
Capacitor	50Hz	20	20	30	40
	60Hz	20	20	20	30

(c) 400V 3Phase Motors

Motor	kW	0.75	1.5	2.2	3.7	5.5	7.5	11	15	19	22	30	37	55
	HP	1	2	3	5	7.5	10	15	20	25	30	40	50	75
Capacitor	50Hz	7.5	10	15	20	30	40	50	75	75	100	125	150	250
	60Hz	5	7.5	10	15	20	30	40	50	75	75	100	125	200

② AC Arc Welders 200V

Max. Input (kVA)	3 min.	5 min.	7.5 min.	10 min.	15 min.	20 min.	25 min.	30 min.	35 min.	40 min.	45 min. below 50
Capacitor uF	100	150	200	250	300	400	500	600	700	800	900

(Note) The same capacitance applies to 50Hz and 60Hz. Use a capacitor with 50% of the above capacitance for AC resistance welders and DC arc welders.

APPLICATION NOTES

Do not place the capacitors at the following locations.

- ① where rain or water drop falls
- ② where there is heavy iron powder or dust
- ③ areas with high relative humidity
- ④ area with corrosive gases

⑤ where condensation of humidity occurs

- ⑥ where salt damage is expected
- ⑦ where vibration occurs
- ⑧ where the ambient temperature is not within -25°C to +45°C and direct sunlight is present

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

INSTALLATION WORKS

① When installing two or more capacitors at the same location, secure the spacing between units of 25mm or more. For capacitors rated at 20kvar or more (220V & 400V), the spacing should be 50mm or more.
※ Type N2 does not require

- ② Ensure to fasten the screws to connect cables.
- ③ Do not mount type E horizontally
- ④ Ground type E capacitors using the grounding terminal.

SWITCHING OF CAPACITORS

To switch off an apparatus to which a capacitor is connected, be sure to disconnect the capacitor from the power source at the same

time. If the capacitor remains connected to power source, the power source as well as the capacitor would be affected adversely.

PROTECTIVE DEVICE

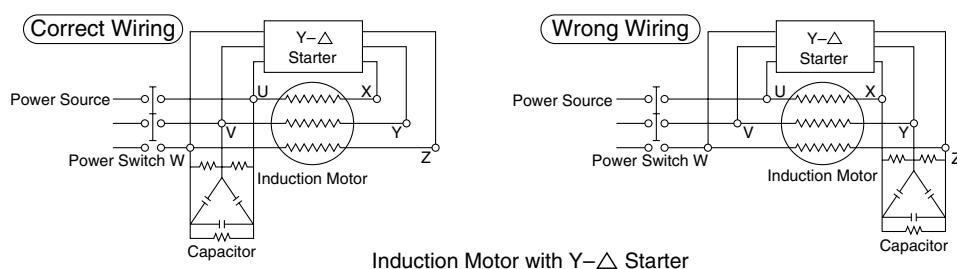

The capacitors have an internal protective device. Should a failure (breakdown of the internal windings) occurs in the capacitor, the protective device will activate to disconnect the

capacitor from the line. Be sure to replace the failed capacitor with a new one.

CONNECTION TO INDUCTION MOTORS WITH A STAR-DELTA STARTER

Wrong wiring of low voltage capacitor to an induction motor with a star-delta starter would cause the capacitor to

breakdown. Be sure to do the correct wiring as shown below.

• TYPE N2 (200V), TYPE E(200V)

FEATURES

TYPE N2

- ① Idea for mounting in a panel. The capacitors can be mounted on a 35mm rail per IEC easily to save labor.
- ② Can be mounted in any directions.
- ③ Provides a high safety due to dry type not using oil and internal protective device.

TYPE E

- ① Smaller by 15-30% than our conventional design due to the low loss dielectrics used.
- ② Enhanced reliability for connection due to the quick-connect terminal blocks used.

SPECIFICATIONS

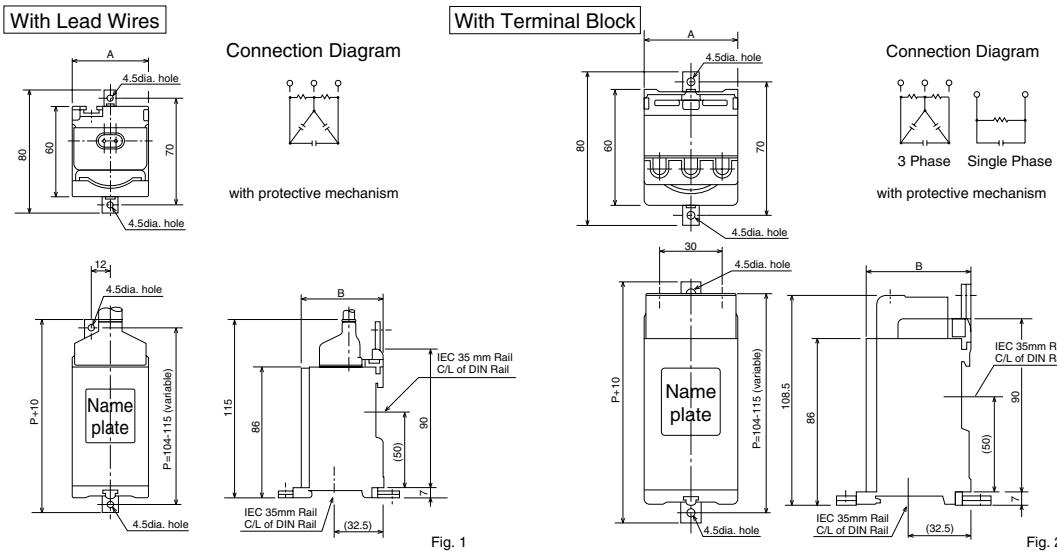

System Voltage : 200VuF

Type	N2 & E
Installation Location	Indoor only, altitude : 2000m max.
Ambient temperature	-25°C to +45°C (24 hour average : 35°C max., annual average : 25°C max.)
Output Tolerance	-5% to +15% of rated output (Unbalance among phases 1.08 or less)
Voltage Withstand	T - T : 2.15 x rated voltage for 2 seconds T - C : 3000V for 10 seconds (Type E)
Dissipation Factor	0.12% max. at 20°C

Permissible Overloads	110% of rating (8 hours max. per 24 hours)
Maximum Voltage	115% of rating (30 minutes max. per 24 hours)
	120% of rating (5 minutes max.)
	130% of rating (1 minute max.)
	overvoltage exceeding 115% : 200 times max.
Maximum Current	130% max. of rating
Discharge Resistors	Discharge to 75V or less in 3 minutes
Safety Test	Per para. 8.12 of JIS C 4901
Paint Color	Munsell 5Y7/1 (Type E)
Applicable Standard	JIS C 4901-2000

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

SPECIFICATIONS

System Voltage : 400VuF

Type	RG-2
Installation Location	Indoor only, altitude : 2000m max.
Ambient temperature	-25°C to +45°C (24 hour average : 35°C max., annual average : 25°C max.)
Output Tolerance	-5% to +15% of rated output (Unbalance among phases 1.08 or less)
Voltage Withstand	T - T : 2.15 x rated voltage for 2 seconds T - C : 3000V for 10 seconds (Type E)
Dissipation Factor	0.2% max. at 20°C

Permissible Overloads	110% of rating (8 hours max. per 24 hours)
Maximum Voltage	115% of rating (30 minutes max. per 24 hours)
	120% of rating (5 minutes max.)
	130% of rating (1 minute max.)
	overvoltage exceeding 115% : 200 times max.
Maximum Current	130% max. of rating
Discharge Resistors	Discharge to 75V or less in 3 minutes
Safety Test	Per para. 8.12 of JIS C 4901
Paint Color	Munsell 5Y7/1
Applicable Standard	JIS C 4901-2000

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

TYPE RG-2 LOW VOLTAGE POWER CAPACITORS (for L=6%) Combined Output 10-50kvar

SPECIFICATIONS

System Voltage : 220V

Type	RG-2, oil filled
Installation Location	Indoor only, altitude 2000m max.
Ambient temperature	-25°C to +45°C (24 hour average : 35°C max., annual average : 25°C max.)
Tolerance	-5% to +15% of rated output Phase unbalance : 108% max. (3 phase)
Voltage Withstand	T - T : 2.15 x rated voltage for 2 seconds T - C : 3000V for 10 seconds
Dissipation Factor	0.2% max. at 20°C

Permissible Overload	110% of rating (8 hours max. per 24 hours)
Maximum Voltage	115% of rating (30 minutes max. per 24 hours)
	120% of rating (5 minutes max.)
	130% of rating (1 minute max.)
	overvoltage exceeding 115% : 200 times max. over life
Maximum Current	130% max. of rating
Discharge Resistors	Discharge to 75V or less in 3 minutes
Safety Test	Per para. 8.12 of JIS C 4901
Paint Color	Munsell 5Y7/1
Applicable Standard	JIS C 4901-2000

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

TYPE DR-1 SERIES REACTORS (for L=6%, I_s=55%) Combined Output 10-300kvar

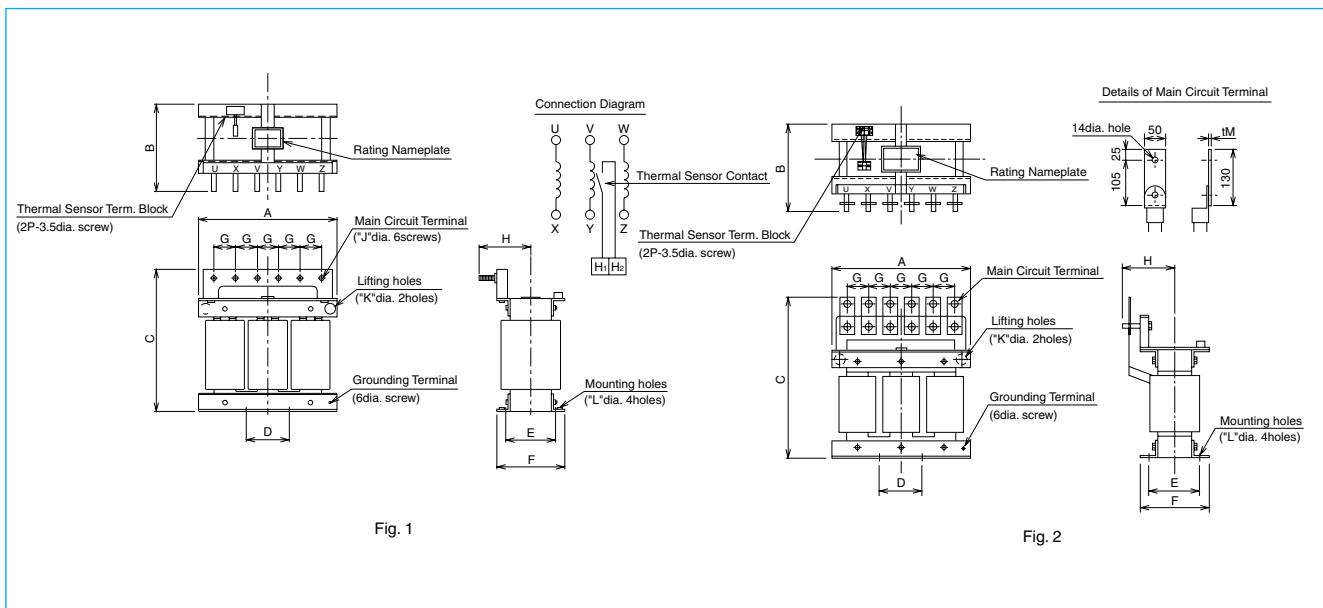

SPECIFICATIONS

System Voltage : 220V or 440V

Type	DR-1, dry type
Installation Location	Indoor only, altitude : 2000m max.
Ambient temperature	-20°C to +45°C (24 hour average : 35°C max., annual average : 25°C max.)
Insulation Class	Class H
System Voltage	220V or 440V
Number of Phases	3 phase

Rated Frequency	50Hz or 60Hz
Reactance	6% of capacitor reactance
Permissible Overload	130% of rating (5th harmonic current - not more than 55% of the fundamental current)
Maximum Current	more than 55% of the fundamental current)
Temperature Rise	115°C max. at the coils (per resistance method)
Applicable Standard	JIS C 4901-2000

- (Notes) 1. The asterisk ★ denotes voltage. 22 and 44 represent 220V and 440V respectively.
 2. The mark * denotes frequency. 5 and 6 represent 50Hz and 60Hz respectively.
 3. Class I reactors (I_s=35%) are also available.
 4. Reactors with I_s=70% are also available.

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

OIL-LESS V-PAC FOR INSTALLATION IN PANELS (with L=6%, I_s=55%)

FEATURES

① Enhanced Harmonic Withstand Capability

The equipment now employs series reactors which have enhanced harmonic withstand capability of $I_s=55\%$ in accordance with the new standard JIS C 4902.

② Oil-less Type

No insulation oils are used in the equipment to offer excellent safety.

③ Micro Miniatures

The equipment can be placed in a 700mm deep panel.

④ Standardized Units

15 - 150 kvar units are available by combining the standard units of 15 kvar, 25 kvar and 50 kvar.

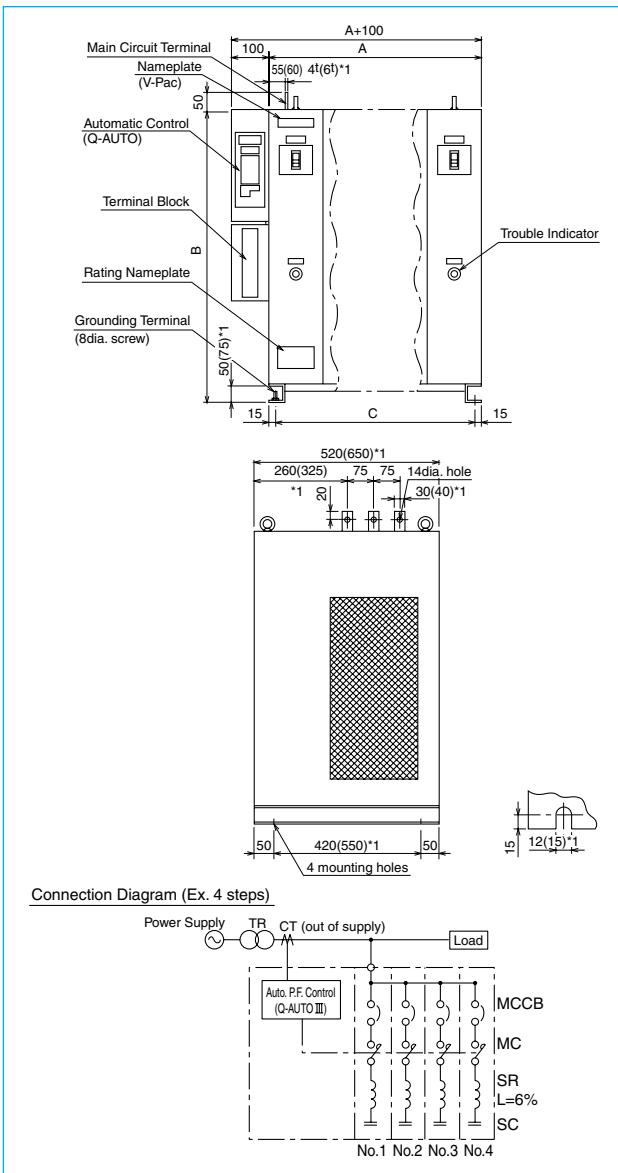

SPECIFICATIONS

Mounting Location	Restricted to installation inside a panel	
System Voltage	220V or 440V	
No. of Phases	3 phase	
Control Method	Power factor detection type, sequence switching control	
Device	MCCB	
Protection	Capacitors	Built-in protective function
	Reactors	Thermal Sensor

APPLICATION NOTES

- ① Be sure to install the equipment in a panel.
- ② Do not stack the equipment in double tiers.
- ③ Consideration should be given to the adequate ventilation inside the panel that will help reduce the temperature rise caused by heat of the equipment and other apparatus.
- ④ For heat generated by the equipment to calculate ventilation inside the panel, refer to the product specification for V-Pac.
- ⑤ If the breaking capacity of the MCCB is not sufficient, advise us of the rated breaking capacity required. Alternatively, mount a circuit breaker upstream in the line to form cascade breaking system to meet the breaking capacity required.
- ⑥ Standard breaking capacity is as follows.
 - 30kA for 220V, 15kvar units
 - 30kA for 220V, 25kvar units
 - 35kA for 220V, 50kvar units
 - 25kA for 440V, 50kvar units
- ⑦ Be sure to connect a CT (out of supply) to detect load current to the phase R.
- ⑧ It is required to adjust (set) the sensitivity of control current before operation. For a value to be set at, refer to the Operating Instructions.

3 LOW VOLTAGE POWER CAPACITOR EQUIPMENT

FREE STANDING ENCLOSED V-PAC II (with L=6%, I_s=55%)

The Shizuki V-PAC II low voltage power factor correction equipment has achieved the utmost effect to save electric power. The equipment consists of the control unit to detect and control power factor, the thyristor switches to switch on and off the capacitors with solid-state switches, and the capacitors combined with the reactors. The equipment has automatically maintained the desired power factor level, adjusting to the system load requirements.

FEATURES

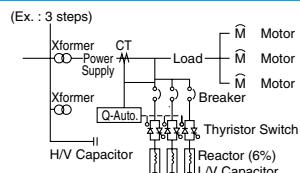

- ① The capacitor switches use contactless thyristors with no mechanical moving parts, providing a semi-permanent life. In addition, the employment of soft-start circuit smoothes the building-up of current waveform, eliminating inrush current.
- ② The series reactors (6%) combined with the capacitor suppress the amplification of harmonics present on the line and reduce inrush current flowing from the line.

- ③ The automatic capacitor control unit Q-AUTO with a built-in microcomputer maintains the system power factor at nearly 100%.
- ④ Special care is given to the safety design, employing the capacitors with a built-in protective device and incorporating alarm contacts in the automatic capacitor control unit to monitor low power factor.

4 SURGE ABSORBING CAPACITORS & GROUNDING CAPACITORS

• TYPE NV-2 Surge Absorbing Capacitors

Abnormal voltage appearing on the line is caused by the internal factors including switching of the circuit, open-circuit, short-circuit and grounding or by the external factor of lightning. The abnormal voltage is propagated on the line to apply excessive voltage to transformers, circuit breakers, potential transformers and current transformers installed at a power plant, and is further transmitted to the generators or rotating machines through the secondary of the transformer, damaging them.

Rotating machines and transformers are generally installed in a narrow facility. Therefore, it is hard to enhance the dielectric strength of the apparatus. Surge absorbing capacitors help protect the apparatus from the abnormal voltage more effectively than any other methods. Described below are the benefits and characteristics of our surge absorbing capacitors.

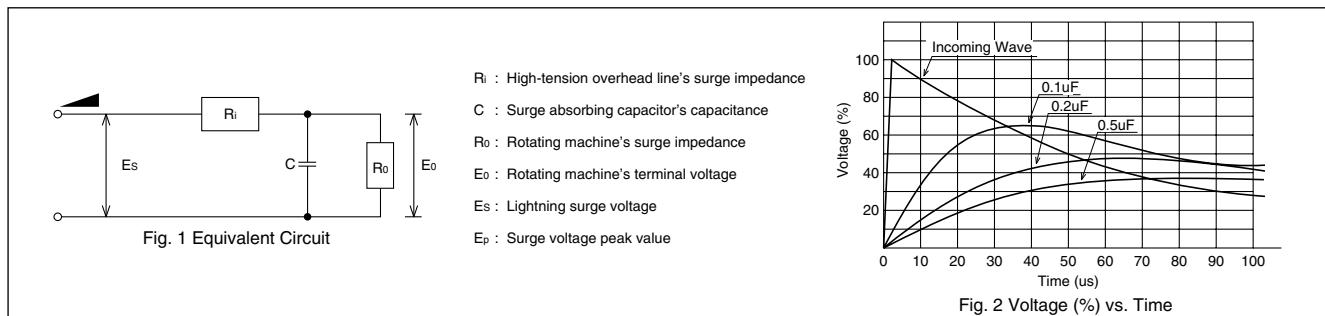

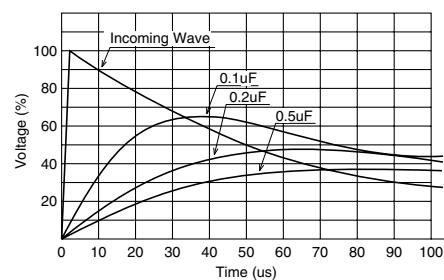

Fig.1 shows the circuit where a surge absorbing capacitor is connected on parallel with a lumped resistance R which represents loads such as generator or transformers. Assuming transmitted wave $E_0 = e^{-\alpha t} - e^{-\beta t}$, the terminal voltage across the load E will be

$$E_s = E_p (e^{-\alpha t} - e^{-\beta t})$$

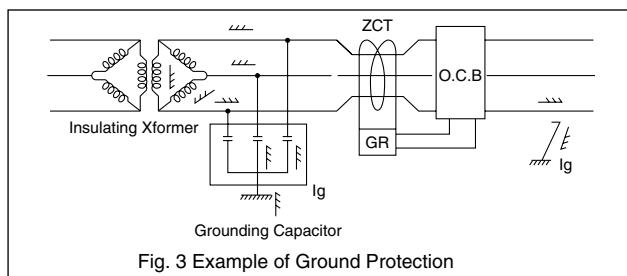

$$E_0 = E_p \frac{1}{CR(\gamma - \alpha)} (e^{-\alpha t} - e^{-\gamma t})$$

To find out how the capacitor helps reduce a surge, let us assume in Fig.1 the surge impedance at the side of the transmission line $Z=200\Omega$ and the surge impedance of the apparatus to be protected $R=2,000\Omega$. The results of calculation are shown in Fig.2 which tells us that the sharper the transmitted waveform is or the larger the capacitance is, the more effectively the capacitor works.

• TYPE NVG-2 Grounding Capacitors

A ground relay to activate the zero-phase-sequence current transformer is installed at the secondary of the step-down insulating transformer in a facility to protect the equipment. In this case, a grounding capacitor needs

to be added at the power source side of ZCT to obtain a zero-phase current for detection as shown in Fig.3. The capacitance required can be calculated from the following equation.

$$C \geq \frac{\lg \times 10^3}{\sqrt{3} \times 2\pi f E} \text{ [uF]}$$

where C : Capacitance per phase of the capacitor [uF]

E : Line-to-line voltage [V]

I_g : Operating current of the ground relay [mA]

f : Frequency [Hz]

SPECIFICATIONS

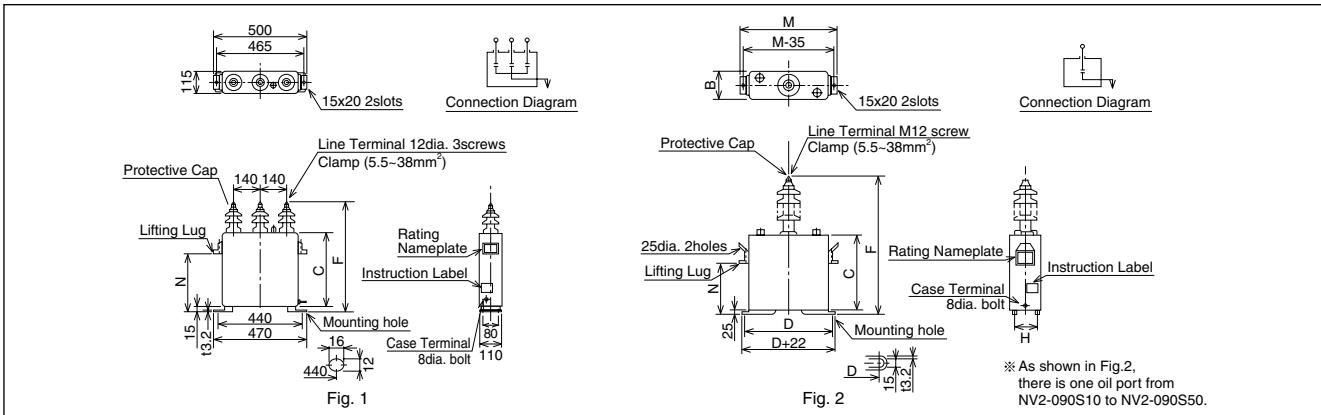

Type	NV-2/NVG-2, oil filled
Installation Location	Indoor and Outdoor
Ambient temperature	-20°C to +50°C

5 HIGH FREQUENCY CAPACITORS

PLASTIC FILM CAPACITORS (ETHY-CON)

Our polyethylene film capacitors were originally developed for the integrating circuit of analog computers. The application was later expanded, because of its low dissipation factor, to include power factor improvement in the high frequency SCR and Motor Generator (MG) type electric furnace heating equipment, and in vacuum tube high frequency oscillators for oscillation, bypassing, or blocking. The capacitors, called "Ethy-con", have enjoyed good customer acceptance.

With the introduction of electrical grade polypropylene film offering a unique characteristic, our efforts made it possible to successfully develop and market polypropylene capacitors for application in the MG type high frequency electric furnace to improve power factor over the range from 1 KHz to 10 KHz.

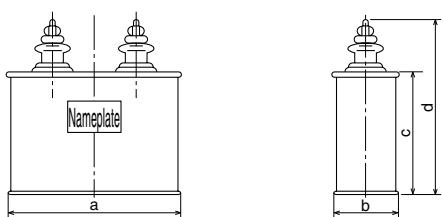

Both polyethylene and polypropylene film capacitors have been found to be acceptable among customers for high frequency applications.

5 HIGH FREQUENCY CAPACITORS

WATER COOLED CAPACITORS

SPECIFICATIONS

Installation Location	Indoors only
Operating Ambient Temperature	0°C to +50°C
Capacitance Tolerance	+10% to -10% of rating
Voltage Withstand	2 times the rated voltage (60Hz)
Cooling Water	45°C maximum at water outlet
Flow Rate of Cooling Water	5 liters minimum per minute
Pressure of Cooling Water	5 kg minimum per cm ²
Paint	No paint

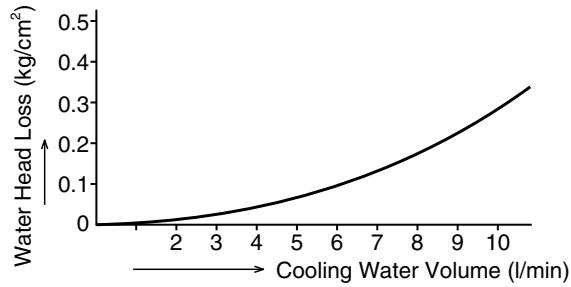

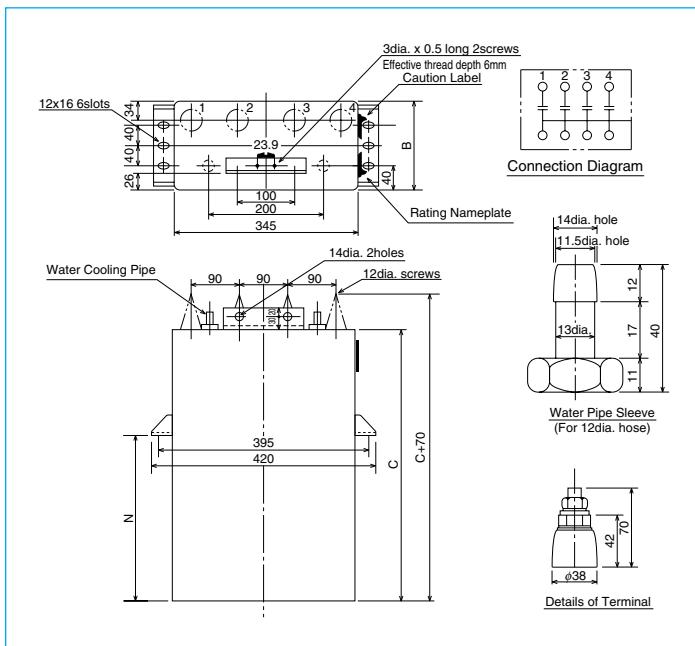

Fig. 1

APPLICATION NOTES

- ① The case forms one of the two electrodes and should be mounted on an insulating rack to isolate from ground before capacitors are placed in operation.
- ② When two capacitor units or more are installed side by side, the clearance of 35mm or more should be provided between the walls of adjoining units.
- ③ The cooling water flow rate should be not less than 5 liters per minute. The outgoing water temperature should not exceed 45°C. The temperature rise of cooling water is 1°C in average per capacitor unit (1,000 kVA).
- ④ The pressure drop of the cooling coil is as shown in Fig.1.
- ⑤ If the capacitors are to be left idle in a freezing temperature after they have been in operation, the cooling coil should be blown free of water to prevent the water from freezing in the coil.
- ⑥ Low voltage terminals use aluminum conductors. Hence, when connecting low voltage terminals, the terminals should be coated with aluminum compound.

6 AUTOMATIC CAPACITOR CONTROLLERS

Type SQ-S4

Type SQ-S4 has automatically controlled the switching of power capacitors to control power factor automatically, saving electric bills.

FEATURES

① Easy to Set

- Control is made aiming at target power factor of 100% by setting the primary and secondary voltages.
- Complicated calculation of VCT ratio or target reactive power is not required.

In addition, setting of capacitance is not also required as the controller identifies the capacitance required automatically.

② Can be used for both of 3-phase 3-wire and 3-phase 4-wire systems.

- The controller can be used either for balanced loads or unbalanced loads in a 3-phase 3-wire circuit or for 3-phase 4-wire circuits.

③ Can be used even for negative-phase-sequence.

- The controller detects negative-phase-sequence to change over internally to positive-phase-sequence automatically. Any works to change the phase sequence is not required.

④ Capacitors can be disconnected under light load conditions.

- The controller detects light load and disconnects capacitors automatically to prevent excessive lead power factor.

- Capacitors can be disconnected at night by the signal from an external time switch to prevent excessive lead. (with the forced breaking circuit)

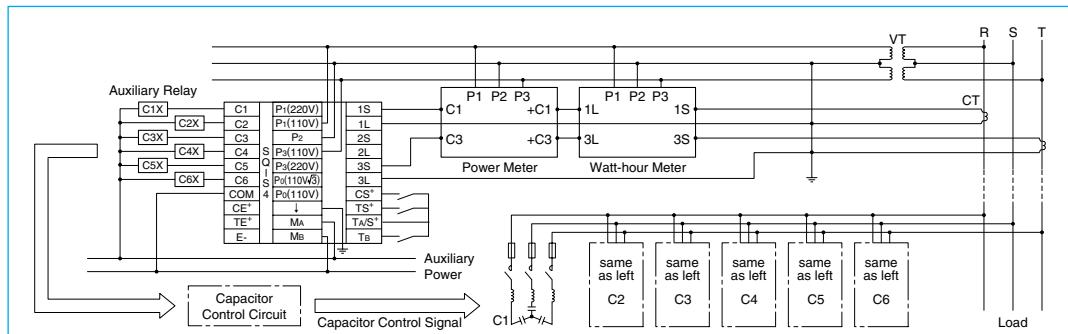

⑤ Control method to suit load can be selected.

- Operation mode can be selected from one of cyclic mode, priority mode and optimum mode.
- Operation to suit capacitor output and load conditions is possible.
- Setting at 6 steps maximum. For more settings, use the two units.

⑥ Can display the measurements.

- | | | |
|---|---|------------------------|
| • Current (I _R , I _S , I _T) | • Voltage (V _{R-S} , V _{S-T} , V _{T-R}) | • Power (kW) |
| • Reactive power (kvar) | • Power factor (cosφ) | • Apparent power (kVA) |

CONNECTION DIAGRAM

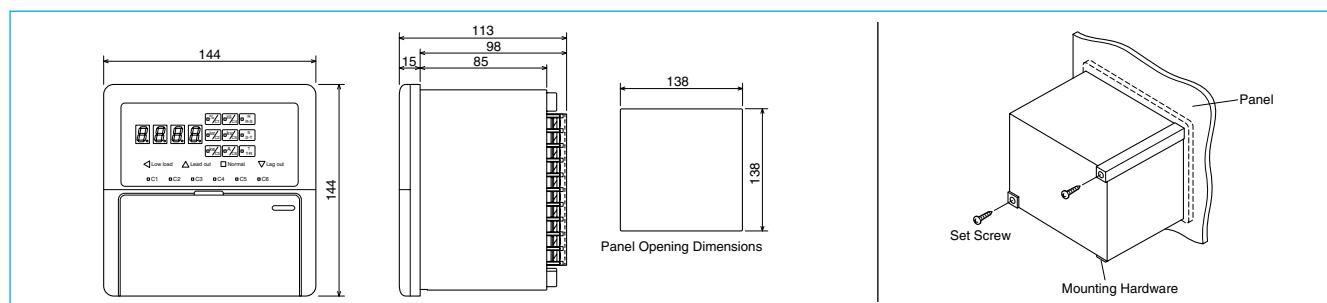

SPECIFICATIONS

Type	SQ-S4	
Installation Location	Indoor only	
Operating Ambient Temperature	-5°C to +50°C	
Input Ratings	Voltage : 110VAC, 0.3A or 220VAC, 0.6A Current : 5AAC, 0.1VA	
Settings	Essential	Primary voltage (preset at 6600V when shipped) Primary current (preset at 100A when shipped)
	Discretionary	Target power factor LAG100-85% (preset at 100% when shipped)
	Timer 1	minute/5 minutes (preset at 5 minutes when shipped)
	Breaking Power Ratio (light load)	0-35% (preset at 10% when shipped)
Operation Mode	Automatic	cyclic/priority/optimum
	Manual	manual ON/automatic/manual OFF

Output	Output contact Continuous exciting output, normally open, 6 circuits, one side common
	Contact capacity 250VAC, 1A; 110VDC, 0.1A
Display	State Control output, lead, lag, proper, light load
	Accuracy Current, voltage, reactive/apparent power±2.5% per JIS C 1102 power facto±5.0%
Data	Current(I _R , I _S , I _T), voltage(V _{R-S} , V _{S-T} , V _{T-R}), power(kW) reactive power(kvar), power factor(%), apparent power(kVA), LED segments 4 digits
Capacitor control	Signal output ON/OFF signal output condition(C1-C6)
Auxiliary Power Supply	100-240VAC, 50-60Hz (Burden :13VA at 110V, 26VA at 220V)
Insulation Resistance	10MΩ at 500VDC (elec. circuit to case)
Gross mass	1.5 kg

DIMENSIONS (mm)

6 AUTOMATIC CAPACITOR CONTROLLERS

Type Q-AUTOMAT III

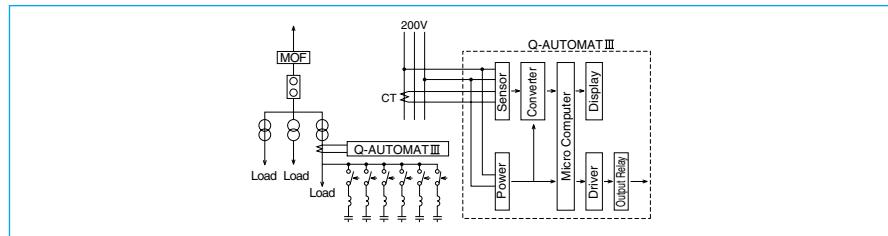

Incorporating a built-in microprocessor, Shizuki automatic capacitor controllers Q-AUTOMAT III always maintain high power factor and provide the best solution to save energy.

FEATURES

- ① Can control 1 step to 6 steps automatically.
- ② Incorporates a built-in microprocessor to achieve compact size and enhanced reliability.
- ③ Processes time to switch in capacitors automatically in such a manner that the time will be shorter for low power factor and longer for high power factor.
- ④ Changes over frequency automatically.
- ⑤ Provides two operation modes; up-down mode and circular mode.
- ⑥ Displays power factor at all times.
- ⑦ Can switch in and off capacitors manually.
- ⑧ Has alarm contacts. (which will activate when power factor remains at 85% or less for 3 minutes or more.)

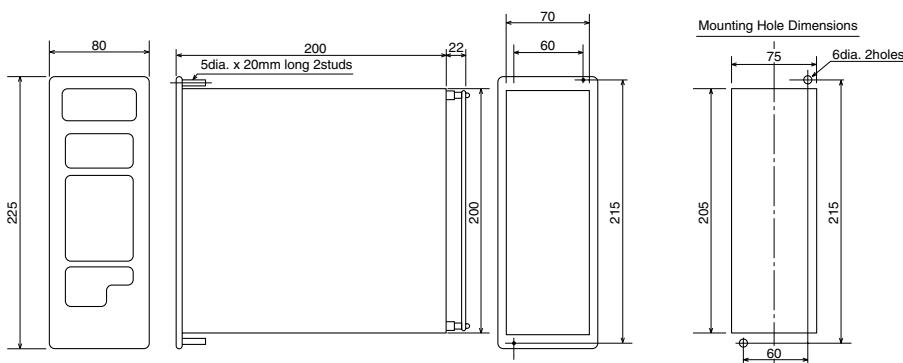

CIRCUIT CONFIGURATION

SPECIFICATIONS

Type	Q-AUTOMAT III	Current Input	External CT (phase R), secondary current 5A Burden 5VA
Installation Location	Indoor only	Power Factor Display	LED indicator; lag (red), lead (green)
Operating Ambient Temperature	-5°C to +50°C	No. of Steps	1 - 6 steps
Power Supply	100V/110VAC or 200/220VAC	Output Contact Capacity	240VAC, 5A ($\cos\theta=0.4$)
Power Factor Setting	Microcomputer computes and sets at 0.99.	Alarm Output Terminals	The contacts will be on when power factor remains at 0.85 or less (lead or lag) for 3 minutes or more.
Applicable Load	3 phase balanced loads, single phase loads Does not work properly if phases are unbalanced	Others	With the function to prevent hunting at light load
Voltage Input	System voltage (phase R - T) 100/110VAC or 200/220VAC Burden 15VA
